tells you they have the qualifications
 are reliable or at least have jumped through the needed hoops

tells abt how the drugs were admitted to the rat: Simulating ppl

It is now one hundred years since drugs were first banned - and all through this long century of waging war on drugs, we have been told a story about addiction, by our teachers, and by our governments. This story is so deeply ingrained in our minds that

puts into perspective how long the drug has been around
 powerful word to show the severity of the situation

we take it for granted. It seems obvious. It seems manifestly true. Until I set off three and a half years ago on a 30,000-mile journey to figure out what is really driving the drug war, I believed it too. But what I learned on the road is that almost everything we have been told about addiction is wrong - and there is a very different story waiting for us, if only we are ready to hear it.

Connects reader
 meaning in a way that is clear/obvious to eye/mind

Simplifying info = sensitive & some ppl are not able to tolerate/comprehend information or are not ready for the truth

figurative way of giving a visual on how to connect reader to topic

If we truly absorb this new story, we will have to change a lot more than the drug war. We will have to change ourselves.

interesting way to describe ppl
 gives author a much more educated appearance when he uses language that flows nicely
 makes the sentence/word about ppl in their own right but also descriptive yet not at the same time

I learned it from an extraordinary mixture of people I met on my travels. From the surviving friends of Billie Holiday, who helped me to learn how the founder of the war

who - an addict → helps to shed light from a primary source gives a unique outlook to story

idea on the idea we are all privileged, which may not be true for everyone

books - puts an opinion in your mind out from education & the gov view & spread info abt the addiction + called it a story puts a view on how there isn't enough seriousness abt the problems can also be seen as a bit humorous?

on drugs stalked and helped to kill her. From a Jewish doctor who was smuggled out of the Budapest ghetto as a baby, only to unlock the secrets of addiction as a grown man. From a transsexual crack dealer in Brooklyn who was conceived when his mother, a crack-addict, was raped by his father, an NYPD officer. From a man who was kept at the bottom of a well for two years by a torturing dictatorship, only to emerge to be elected President of Uruguay and to begin the last days of the war on drugs.

background on the trauma which the person experienced in early childhood

background into why article was started/written

author seem less educated & respect of those ppl

I had a quite personal reason to set out for these answers. One of my earliest memories as a kid is trying to wake up one of my relatives, and not being able to. Ever since then, I have been turning over the essential mystery of addiction in my mind - what causes some people to become fixated on a drug or a behavior until they can't stop? How do we help those people to come back to us? As I got older, another of my close relatives developed a cocaine addiction, and I fell into a relationship with a heroin addict. I guess addiction felt like home to me.

shows questioning of own person life & wondering of themselves

author get reader to consider that on growth paper to consider that on questions

If you had asked me what causes drug addiction at the start, I would have looked at you as if you were an idiot, and said: "Drugs. Duh." It's not difficult to grasp. I thought I had seen it in my own life. We can all explain it. Imagine if you and I and the next twenty people to pass us on the street take a really potent drug for twenty days.

There are strong chemical hooks in these drugs, so if we stopped on day twenty-one, our bodies would need the chemical. We would have a ferocious craving. We would be addicted. That's what addiction means.

extreme & unpleasant

over view helps reader to understand what the problem & addiction means on a personal level

puts an example of the perspective showing an example which helps to better connect reader to problem gives logic & emotions to demonstrate this

One of the ways this theory was first established is through rat experiments - ones that were injected into the American psyche in the 1980s, in a famous advert by the Partnership for a Drug-Free America. You may remember it. The experiment is simple. Put a rat in a cage alone with two water bottles. One is just water. The other is water laced with heroin or cocaine. Almost every time you run this experiment, the rat will become obsessed with the drugged water, and keep coming back for more and more, until it kills itself.

where the article was done in USA

human soul, mind, or spirit

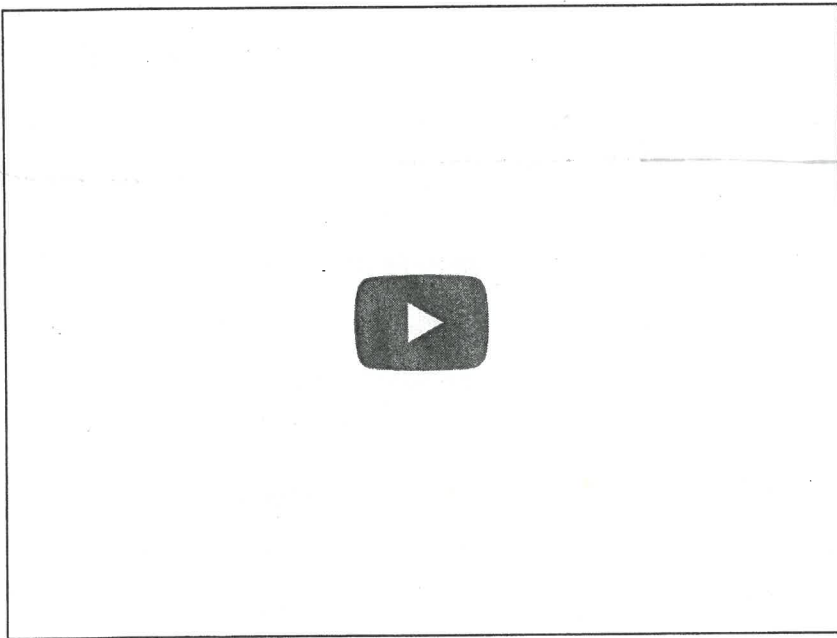

+ gives a visual powerful words to describe addiction

connects rats to American psyche

begins idea abt loneliness

powerful verb to describe how the rats reacted to the drug laced water

shows rat was unable to stop

The advert explains: "Only one drug is so addictive, nine out of ten laboratory rats will use it. And use it. And use it. Until dead. It's called cocaine. And it can do the same thing to you."

ties reader back into data

ethos
credibility

But in the 1970s, a Professor of Psychology in Vancouver called Bruce Alexander noticed something odd about this experiment. The rat is put in the cage all alone. It has nothing to do but take the drugs. What would happen, he wondered, if we tried this differently? So Professor Alexander built Rat Park. It is a lush cage where the rats would have colored balls and the best rat-food and tunnels to scamper down and plenty of friends: everything a rat about town could want. What, Alexander wanted to know, will happen then?

Changing variables help to show a deeper outlook into how the experiment had credible results

who

In Rat Park, all the rats obviously tried both water bottles, because they didn't know what was in them. But what happened next was startling.

The rats with good lives didn't like the drugged water. They mostly shunned it, consuming less than a quarter of the drugs the isolated rats used. None of them died.

While all the rats who were alone and unhappy became heavy users, none of the rats who had a happy environment did.

characteristics of ppl behaviors invoke emotion from reader
b/c everyone at one time in life has experienced loneliness
& unhappiness

At first, I thought this was merely a quirk of rats, until I discovered that there was – at the same time as the Rat Park experiment – a helpful human equivalent taking place. It was called the Vietnam War. Time magazine ^{who → source of information} reported using heroin was "as common as chewing gum" among U.S. soldiers, and there is solid evidence to back this up: some 20 percent of U.S. soldiers had become addicted to heroin there, according to a study published in the Archives of General Psychiatry. ^{produces credibility} Many people were understandably terrified: they believed a huge number of addicts were about the head home when the war ended.

But in fact, some ^{logos} 95 percent of the addicted soldiers – according to the same study – simply stopped. Very few had rehab. They shifted from a terrifying cage back to a pleasant one, so didn't want the drug any more.

Professor Alexander ^{who → prof = level of education} argues this discovery is a ^{meaning very great intense (adjective)} profound challenge both to the right-wing ^{connects experiment back to the story again tying it back in} view that addiction is a moral failing caused by too much hedonistic partying, and the liberal ^{bring political views into site} view that addiction is a disease taking place in a chemically hijacked brain. In fact, he argues, addiction is an adaptation. It's not you. It's your cage. ^{great way of describing how the drugs}

After the first phase of Rat Park, Professor Alexander then took this test further. He reran the early experiments, where the rats were left alone, and became compulsive users of the drug. He let them use for fifty-seven days – if anything can hook you, it's that. Then he took them out of isolation, and placed them in Rat Park. He wanted to know – if you fall into that state of addiction, is your brain hijacked, so you can't recover? Do the drugs take you over? What happened is – again – striking. The rats seemed to have a few twitches of withdrawal – but they soon stopped their heavy use, and went back to having a normal life. The good cage saved them. ^{proving he did it through experiment testing many aspect}

^{bias → normal is different & shouldn't be seen as only interactions in ppl make things} When I first learned about this, I was puzzled. How can this be? This new theory is such a radical assault on what we have been told that it felt like it could not be true.

But the most scientists ^{who → ppl w high degree of knowledge in that field = backing info} I interviewed, and the more I looked at their studies, the more I discovered things that don't seem to make sense – unless you take account of this new approach. ^{ethos}

explains how the chemicals affect the body & makes one reliant on them :: connecting reader to text

Here's one example of an experiment that is happening all around you, and may well happen to you one day. If you get run over today and you break your hip, you will probably be given diamorphine - the medical name for heroin. In the hospital around you, there will be plenty of people also given heroin for long periods, for pain relief. The heroin you will get from the doctor will have a much high purity and potency than the heroin being used by street-addicts, who have to buy from criminals who adulterate it. So if the old theory of addiction is right - it's the drugs that cause it; they make your body need them - then it's obvious what should happen. Loads of people should leave hospital and try to score smack on the streets, to meet their habit.

But here's the strange thing. It virtually never happens. As the Canadian doctor Gabor Mate was the first to explain to me, medical users just stop, despite months of use. The same drug, used for the same length of time, turns street-users into desperate addicts - and leaves medical patients unaffected.

In short explains the desperation which these ppl feel & that they must turn to to feel ok

Interesting the split of ppl & how it is varied due to the dosage & how ppl get access to it, of course one uses it for pain after surgery etc but usually drug ppl use for reasons related to trauma, loneliness, etc
If you still believe - as I used to - that addiction is caused by chemical hooks, this makes no sense. But if you believe Bruce Alexander's theory, the picture falls into place. The street-addict is like the rats in the first cage, isolated, alone, with only one source of solace to turn to. The medical patient is like the rats in the second cage. She is going home - to a life where she is surrounded by the people she love. The drug is the same, but the environment is different.

depending on environment, it changes the outcome/result of how the rats are affected emotionally
This gives us an insight that goes much deeper than the need to understand addicts.

on the pyramid of basic human needs love & belonging is third to the bottom of the pyramid which is important to sustain life

Professor Peter Cohen argues that human beings have a deep need to bond and form connections. It's how we get our satisfaction. If we can't connect with each other, we will connect with anything we can find - the whirr of a roulette wheel or the prick of a syringe. He says we should stop talking about 'addiction' altogether, and instead call it 'bonding'. A heroin addict has bonded with heroin because she couldn't bond as fully with anything else.

So the opposite of addiction is not sobriety. It is human connection.

seen as a basic human need

When I learned all this, I found it slowly persuading me, but I still couldn't shake off a nagging doubt. Are these scientists saying chemical hooks make no difference? It was

lack of interest -> indifference?
no dif = no change

explained to me - you can become addicted to gambling, and nobody thinks you inject a pack of cards into your veins. You can have all the addiction, and none of the chemical hooks. I went to a Gamblers' Anonymous meeting in Las Vegas (with the permission of everyone present, who knew I was there to observe) and they were as plainly addicted as the cocaine and heroin addicts I have known in my life. Yet there are no chemical hooks on a craps table.

high table use for playing craps & that has a raised rim against which dice are thrown
unclear how craps table is a valid way to describe the situation, frankly unsure what it means in this sentence
But still - surely, I asked, there is some role for the chemicals? It turns out there is an experiment which gives us the answer to this in quite precise terms, which I learned about in Richard DeGrandpre's book 'The Cult of Pharmacology.'

who author of book

Everyone agrees cigarette smoking is one of the most addictive processes around. The chemical hooks in tobacco come a drug inside it called nicotine. So when nicotine patches were developed in the early 1990s, there was a huge surge of optimism - cigarette smokers could get all of their chemical hooks, without the other filthy (and deadly) effects of cigarette smoking. They would be freed.

who place of research

ties back in the thought which ppt had in the 1990s of optimism

But the Office of the Surgeon General has found that just 17.7 percent of cigarette smokers are able to stop using nicotine patches. That's not nothing. If the chemicals drive 17.7 percent of addiction, as this shows, that's still millions of life ruined globally. But what it reveals again is that the story we have been taught about The Cause of Addiction lying with chemical hooks is, in fact, real, but only a minor part of a much bigger picture.

part of the overall theme

This has huge implications for the one hundred year old war on drugs. This massive war - which, as I saw, kills people from the malls of Mexico to the streets of Liverpool - is based on the claim that we need to physically eradicate a whole array of chemicals because they hijack people's brains and cause addiction. But if drugs aren't the driver of addiction - if, in fact, it is disconnection that drives addiction - then this makes no sense. figurative language → uses imagery to get point across
meaning = destroy completely / put an end to

Ironically, the war on drugs actually increases all those larger drivers of addiction: for example, I went to a prison in Arizona - 'Tent City' - where inmates are detained in tiny stone isolation cages ('The Hole') for weeks and weeks on end, to punish them

cages + isolation → ties back into the rat experiment - reminding reader of that info/science proven

powerful line used to tie in different addictions but bring it back to drug addiction

strong descriptive words

shows he looks at different viewpoints & gets info from a primary source
identifies the writers credibility

for drug use. It is as close to a human recreation of the cages that guaranteed deadly addiction in rats as I can imagine. And when those prisoners get out, they will be unemployable because of their criminal record - guaranteeing they will be cut off ever more. I watched this playing out in the human stories I met across the world.

There is an alternative You can build a system that is designed to help drug addicts to reconnect with the world - and so leave behind their addictions.

This isn't theoretical. It is happening. I have seen it. Nearly fifteen years ago, Portugal had one of the worst drug problems in Europe, with 1 percent of the population addicted to heroin. They had tried a drug war, and the problem just kept getting worse. So they decided to do something radically different. They resolved to decriminalize all drugs, and transfer all the money they used to spend on arresting and jailing drug addicts, and spend it instead on reconnecting them - to their own feelings, and to the wider society. The most crucial step is to get them secure housing, and subsidized jobs - so they have a purpose in life, and something to get out of bed for. I watched as they are helped, in warm and welcoming clinics, to learn how to reconnect with their feelings, after years of trauma and stunning them into silence with drugs.

One example I learned about was a group of addicts who were given a loan to set up a removals firm. Suddenly, they were a group, all bonded to each other, and to the society, and responsible for each other's care.

The results of all this are now in. An independent study by the British Journal of Criminology found that since total decriminalization, addiction has fallen, and injecting drug use is down by 50 percent. I'll repeat that: injecting drug use is down by 50 percent. Decriminalization has been such a manifest success that very few people in Portugal want to go back to the old system. The main campaigner against the decriminalization back in 2000 was Joao Figueira - the country's top drug cop. He offered all the dire warnings that we would expect from the Daily Mail or Fox News. But when we sat together in Lisbon, he told me that everything he predicted had not come to pass - and he now hopes the whole world will follow Portugal's example.

This isn't only relevant to the addicts I love. It is relevant to all of us, because it forces us to think differently about ourselves. Human beings are bonding animals. We need to connect and love. The wisest sentence of the twentieth century was E.M. Forster's - only connect. But we have created an environment and a culture that cut us off from connection, or offer only the parody of it offered by the internet. The rise of addiction is a symptom of a deeper sickness in the way we live - constantly directing our gaze towards the next shiny object we should buy, rather than the human beings all around us.

The writer George Monbiot has called this "the age of loneliness." We have created human societies where it is easier for people to become cut off from all human connections than ever before. Bruce Alexander - the creator of Rat Park - told me that for too long, we have talked exclusively about individual recovery from addiction.

We need now to talk about social recovery - how we all recover, together, from the sickness of isolation that is sinking on us like a thick fog.

But this new evidence isn't just a challenge to us politically. It doesn't just force us to change our minds. It forces us to change our hearts.

Loving an addict is really hard. When I looked at the addicts I love, it was always tempting to follow the tough love advice doled out by reality shows like Intervention - tell the addict to shape up, or cut them off. Their message is that an addict who won't stop should be shunned. It's the logic of the drug war, imported into our private lives. But in fact, I learned, that will only deepen their addiction - and you may lose them all together. I came home determined to tie the addicts in my life closer to me than ever - to let them know I love them unconditionally, whether they stop, or whether they can't.

When I returned from my long journey, I looked at my ex-boyfriend, in withdrawal, trembling on my spare bed, and I thought about him differently. For a century now, we have been singing war songs about addicts. It occurred to me as I wiped his brow - we should have been singing love songs to them all along.

powerful conclusion which used war songs as a way to conclude how the solution should be done, which tied back into the thesis on how the the solution suggested works & evidence to back it

Author Style: used persuasive techniques like rhetorical question - which got reader to think about connections w themselves & questioning
 entices reader to read on & debate/compare what the author says
 to what the reader believes → this plays w reader's morals
 • use analogys to really drive the main point abt how drugs
 are addictive, yet society is going w it the wrong way. The analogy
 'Chemical hooks' is used many times to help reader follow
 info back which helps to keep the author's article on point
 ↳ personal anecdotes were used, uses inclusive language
 very descriptive & used info to which directly engage
 drive emotions to reader audience → words like US &
we & you
 ↳ emotive language → reached for emotions & used words/phrases
 to help push these ideas ex) chemical hooks, alone, unhappy, normal,
 isolated, lack of connection, shackled, caged all these words connect
 w feeling emotions, personal reaches further driving the author's point

Effectiveness → author was able to effectively take thesis statement, back it w info
 & help for the reader to understand then leave them w a conclusion which tied in a suggest
 solution & a personal connection ∴ leaving a lasting effect on reader → leaving an
 imprint on the reader

WHY

→ author made the why clear through direct info given; "I had quite a
 personal reason to set out for these answers" (pg 2) highlighted info show the
 why he set out for the story,

Why

↳ wrote article to spread findings which author found ∴ why → to spread
 information

↓
 give ppl a solution which could help change the course of the future
 (plus had an ex of a place that already done this and saw promising
 results)

- change the way that addicts are treated → give compassion,
 connection, & bonding/love

highlighted sentences
 support why author wrote article / his reasoning
 phrase I believe
 the purpose of his article
